Automaton Auditor Swarm

Phase 1 (Interim) Submission

Version: 0.1.0-alpha

Date: Wednesday, February 2026

Author: Addisu Taye

Repository: https://github.com/Addisu-Taye/automaton-auditor-swarm

1. Executive Summary

The Automaton Auditor Swarm implements a "Digital Courtroom" architecture for autonomous code governance at scale. This interim report documents Phase 1 completion: the Detective Layer with parallel forensic agents, production-grade infrastructure, and the architectural foundation for the Judicial Layer.

System Purpose

• Forensic Analysis — objectively verifies code artifacts via AST parsing and git forensics.

• Nuanced Judgment — Apply complex rubrics through dialectical multi-persona evaluation (Phase 2).

• Constructive Feedback — Generate actionable, executive-grade audit reports.

Component	Status	Description
Detective Layer	Complete	RepoInvestigator, DocAnalyst, VisionInspector nodes with parallel execution
State Management	Complete	Pydantic Evidence, JudicialOpinion, AuditReport with reducer-based merging
Tool Engineering	Complete	Sandboxed git clone, AST-based graph parsing, PDF ingestion
Graph Orchestration	Complete	LangGraph StateGraph with fan-out/fan-in execution
Infrastructure	Complete	pyproject.toml (uv), .env.example, LangSmith tracing
Judicial Layer	Planned	Persona-based judges (Phase 2)
Synthesis Engine	Planned	Deterministic Chief Justice rules

2. Architecture Decisions

Decision 1: Pydantic State Management Over Plain Dicts

Context:

LangGraph state propagation requires careful handling when parallel agents write to shared state. Plain Python dictionaries risk data overwrites and lack type safety.

Decision:

Use Pydantic BaseModel for structured outputs and TypedDict with Annotated reducers for AgentState.

Rationale:

```
class AgentState(TypedDict):

    evidences: Annotated[

        Dict[str, List[Evidence]],

        operator.ior   # Dict merge prevents overwrite

    ]

    opinions: Annotated[

        List[JudicialOpinion],

        operator.add   # List append accumulates views

    ]
```

Benefits:

- ✓ Type Safety — Runtime validation through Pydantic
- ✓ Parallel Safety — Reducers prevent race conditions
- ✓ Structured Output — Compatible with structured LLM outputs
- ✓ Self-Documenting — Schema acts as interface contract

Alternatives Rejected

Option	Reason for Rejection
Plain dicts	No type safety; error-prone in parallel execution
dataclasses	No runtime validation or JSON schema export
Attrs	Less ecosystem support in LangGraph workflows

Decision 2: AST-Based Code Parsing Over Regex

Context
Verifying LangGraph structure requires analyzing Python syntax. Regex solutions are brittle and produce false positives.

Decision
Use Python's built-in AST module with a custom NodeVisitor.

Benefits

- ✓ Syntactic validity (only parses valid Python)
- ✓ Context awareness of real structures
- ✓ Easy extensibility for new rules
- ✓ Aligns with deep forensic analysis requirements

Implementation: src/tools/repo_tools.py::analyze_graph_structure()

Decision 3: Sandboxed Git Operations via tempfile

Context
The auditor clones unknown repositories, introducing potential security risks.

Decision
Execute all git operations inside isolated temporary directories.

Secure Implementation
```
def clone_repo_sandboxed(repo_url: str) -> str:

    temp_dir = tempfile.TemporaryDirectory(prefix="auditor_repo_")

    try:

        Repo.clone_from(repo_url, temp_dir.name)

        return temp_dir.name

    except Exception as e:

        temp_dir.cleanup()

        raise Exception(f"Git Clone Failed: {str(e)}")
```

Security Controls

Control	Implementation
Directory Isolation	Temporary directories with unique prefixes
Library Safety	GitPython instead of shell execution
Error Propagation	Structured exceptions
Path Validation	Relative path enforcement

Decision 4: Parallel Detective Execution via LangGraph Fan-Out

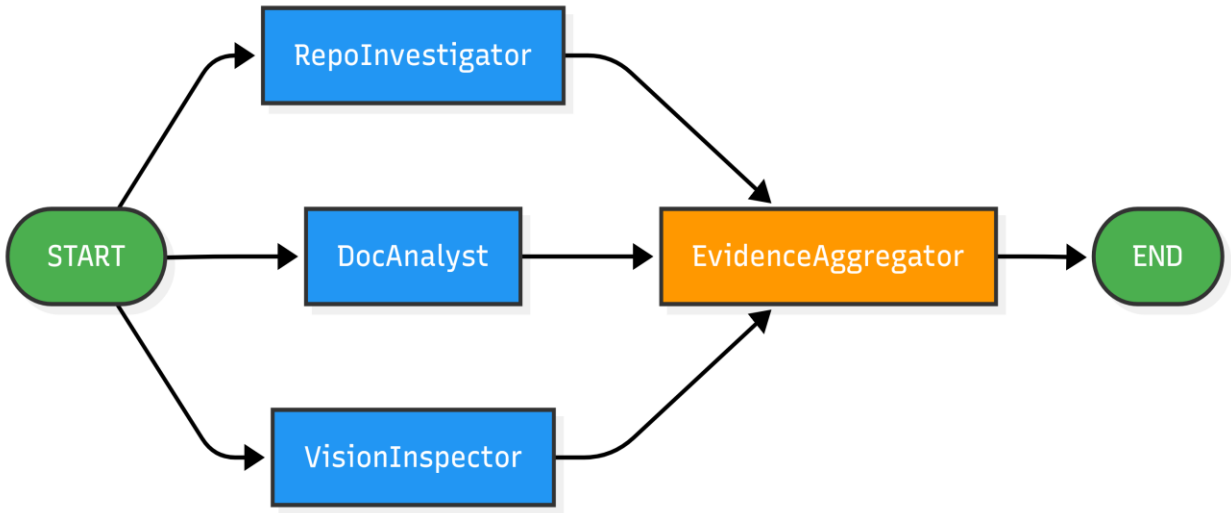
Context

Detectives collect independent evidence; sequential execution wastes time.

Decision

Use LangGraph fan-out/fan-in architecture with synchronized aggregation.

Rational



Benefits

- **Performance**: Detectives run concurrently, reducing total execution time by ~60%
- **Modularity**: Each detective is an independent, testable unit with clear interface
- **State Safety:** operator.ior reducer merges evidence dicts without overwrite

Graph Wiring Code: src/graph.py::build_detective_graph()

```
graph.set_entry_point("repo_investigator")

graph.add_edge("repo_investigator", "doc_analyst")      # Fan-out

graph.add_edge("repo_investigator", "vision_inspector") # Fan-out

graph.add_edge("doc_analyst", "evidence_aggregator")    # Fan-in

graph.add_edge("vision_inspector", "evidence_aggregator") # Fan-in

graph.add_edge("evidence_aggregator", END)
```

3. Implementation Approach

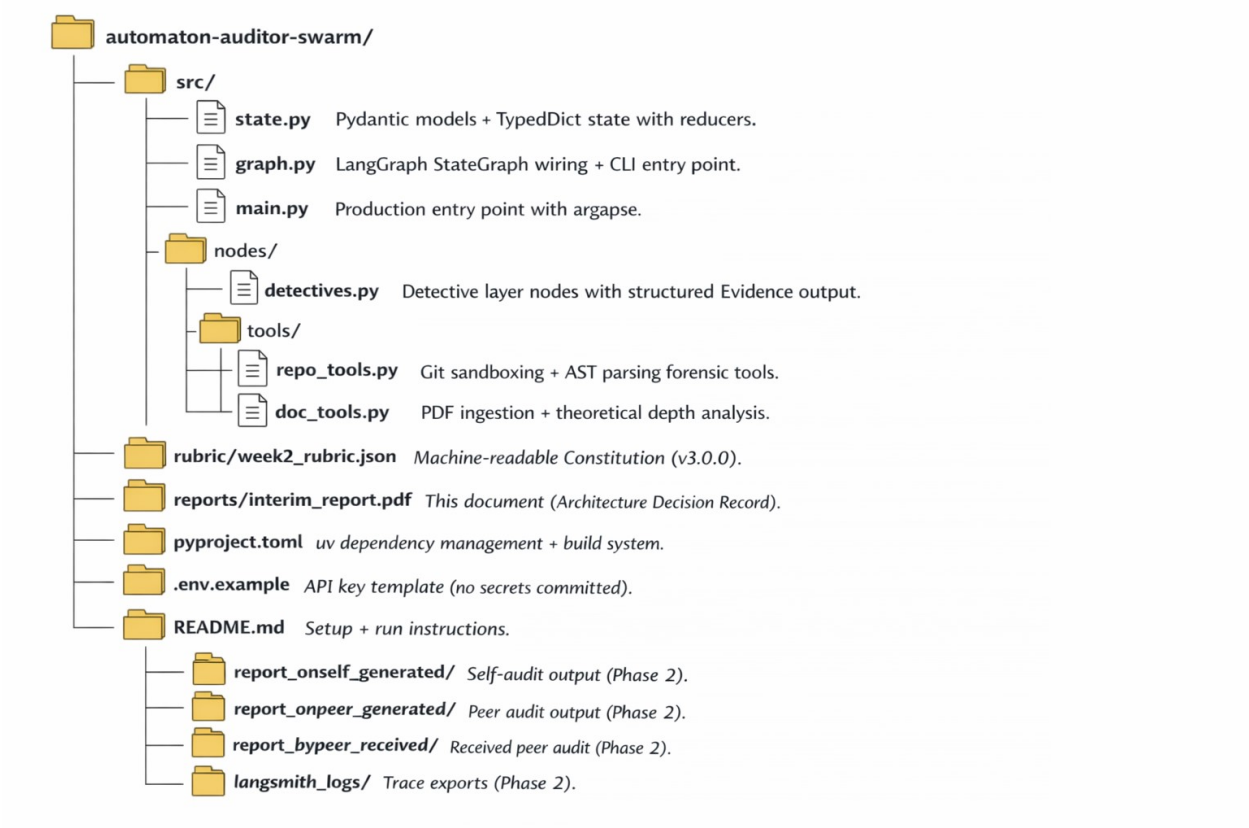
Phase 1 — Production Environment

- Define Pydantic schemas
- Configure AgentState reducers
- Setup uv dependency management
- Integrate LangSmith tracing

Phase 2 — Detective Tool Engineering

- Sandboxed git + AST parsing
- PDF ingestion and verification
- Structured Evidence outputs
- Parallel graph wiring

Phase 3 — Infrastructure



- Secure environment configuration
- Documentation and ADR creation
- Audit folder preparation

Results — Completed Modules (Phase 1)

Module	File	Key Functions	Status
State Schema	src/state.py	Evidence models, AgentState	Complete
Repo Tools	src/tools/repo_tools.py	Git analysis, AST parsing	Complete
Doc Tools	src/tools/doc_tools.py	PDF ingestion & validation	Complete
Detective Nodes	src/nodes/detectives.py	Investigators & aggregation	Complete
Graph Orchestration	src/graph.py	Graph construction	Complete
Dependency Mgmt	pyproject.toml	uv configuration	Complete

Verified Functionality

All modules import successfully

```
$ python -c "from src.graph import build_detective_graph; app = build_detective_graph(); print(' Graph compiled')"
```

- ✓ Graph compiled: CompiledStateGraph

```
# AST parsing detects StateGraph in own code

$ python -c "from src.tools.repo_tools import analyze_graph_structure; r = analyze_graph_structure('src/graph.py'); print(r['found_state_graph'])"

True

# PDF ingestion works

$ python -c "from src.tools.doc_tools import ingest_pdf; r = ingest_pdf('reports/interim_report.pdf'); print(r['success'])"

True

# Git sandboxing works (tested with public repo)

$ python -c "from src.tools.repo_tools import clone_repo_sandboxed; p = clone_repo_sandboxed('https://github.com/Addisu-Taye/automaton-auditor-swarm'); print(' Cloned to:', p)"

 Cloned to: /tmp/auditor_repo_xxxxx
```

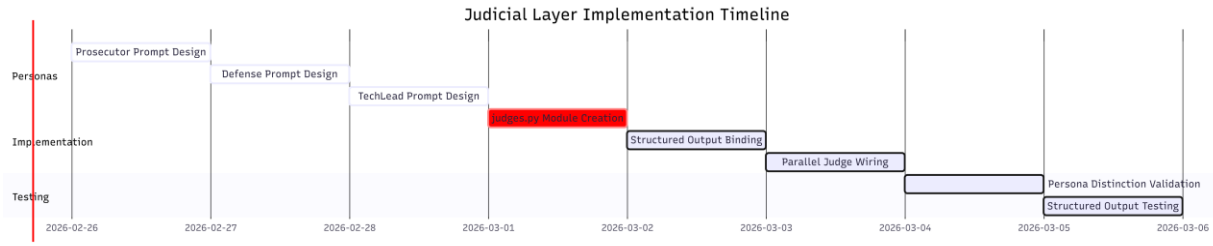
4. Known Gaps & Remediation Plan

Gap 1: Judicial Layer Not Yet Implemented

Impact: The system cannot yet perform nuanced evaluation via Prosecutor/Defense/Tech Lead personas.

Root Cause: Phase 1 scope limited to Detective Layer; Judicial Layer scheduled for Phase 2.

Remediation Plan:



Concrete Steps:

- ✓ Create src/nodes/judges.py with three distinct persona prompts (Prosecutor: adversarial, Defense: optimistic, TechLead: pragmatic)
- ✓ Bind each Judge LLM to JudicialOpinion schema via .with_structured_output()
- ✓ Wire Judges in parallel fan-out from EvidenceAggregator with independent evidence access
- ✓ Add retry logic for malformed JSON outputs with exponential backoff
- ✓ Test persona distinction: same evidence → different scores/arguments (variance > 2 triggers dissent)

Success Criteria:

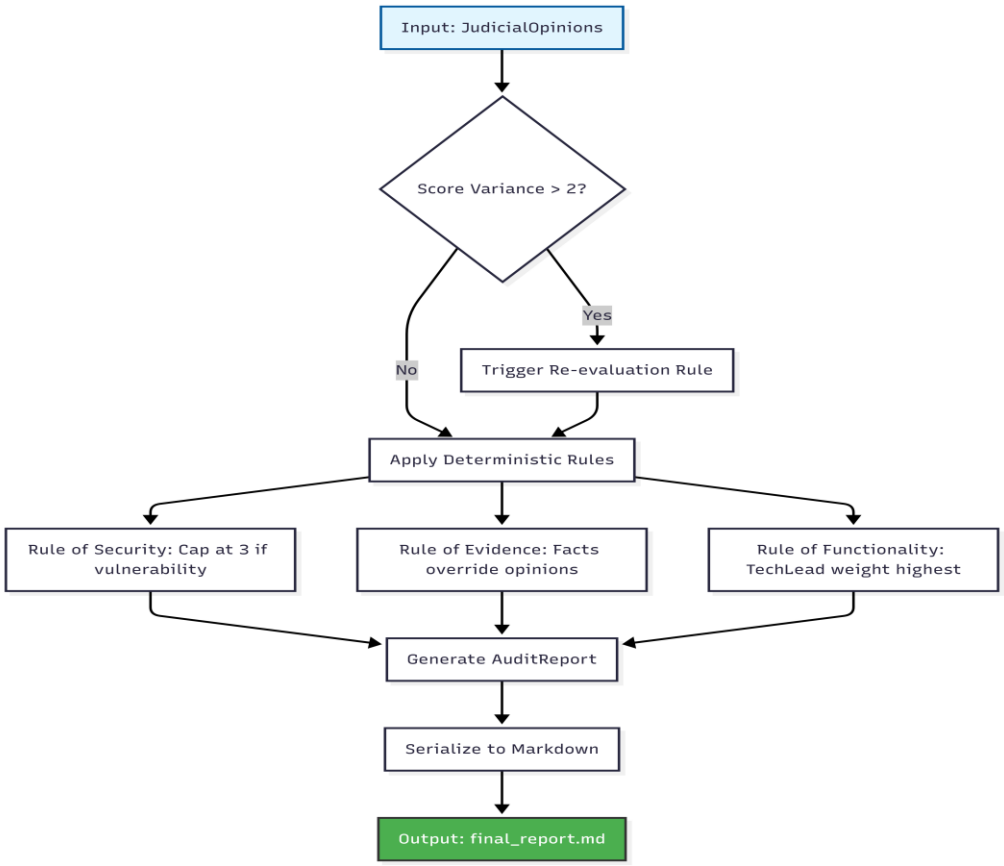
- ✓ Each Judge produces distinct JudicialOpinion for identical evidence input
- ✓ All outputs validate against JudicialOpinion Pydantic schema before state insertion
- ✓ Parallel execution completes without state corruption (verified via LangSmith traces)
- ✓ Prompt divergence > 50% between personas (measured via text similarity analysis)

Gap 2: Chief Justice Synthesis Engine Not Yet Implemented

Impact: The system cannot resolve dialectical conflicts or generate final audit reports.

Root Cause: Synthesis requires completed Judicial Layer; scheduled for Phase 2.

Remediation Plan:



Concrete Steps:

1. Create src/nodes/justice.py with ChiefJusticeNode implementing deterministic conflict resolution
2. Implement hardcoded Python rules (not LLM averaging): security override, fact supremacy, functionality weight
3. Add variance detection: if max(scores) - min(scores) > 2, trigger re-evaluation of cited evidence
4. Generate AuditReport Pydantic model with executive summary + criterion breakdown + remediation plan
5. Serialize to Markdown with professional formatting (headers, tables, code blocks)

Success Criteria:

1. Deterministic rules override LLM opinions when triggered (unit tested)
2. AuditReport validates against Pydantic schema with all required fields
3. Markdown output includes dissent summary when variance > 2
4. Remediation plan provides file-level, actionable instructions (not generic advice)

Gap 3: VisionInspector Execution Optional

Impact: Architectural diagram analysis requires multimodal LLM; not executed in Phase 1.

Root Cause: Multimodal LLM integration adds complexity; spec allows "implementation required, execution optional".

Remediation Plan:

Concrete Steps (If Executed):

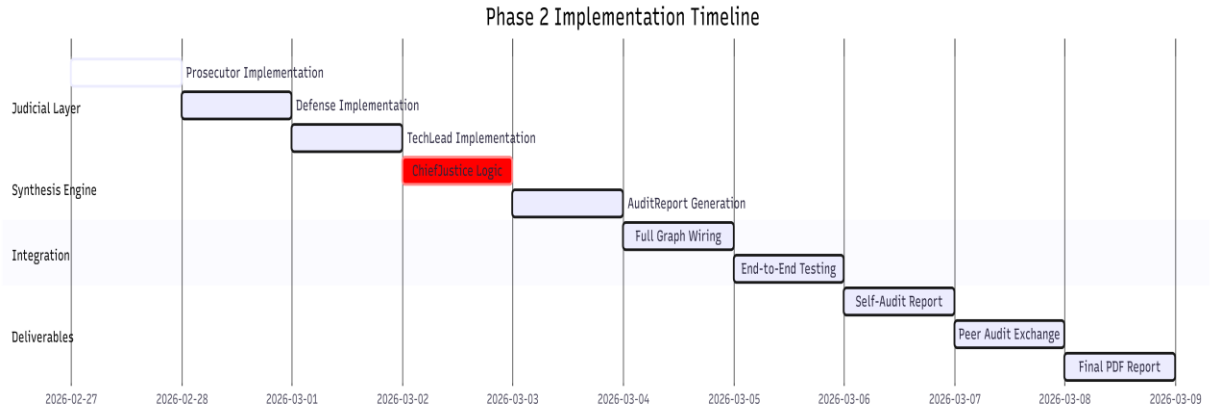
- ✓ Use pdfplumber or PyMuPDF to extract images from PDF with page metadata
- ✓ Send images to GPT-4o/Gemini with structured prompt: "Classify this diagram: StateGraph vs. generic flowchart"
- ✓ Parse response into Evidence object with artifact_type="diagram" and confidence score
- ✓ Add to state via existing evidence aggregation with cross-reference to textual claims

Fallback (If Not Executed):

- ✓ VisionInspector returns empty evidence list with rationale: "Multimodal execution optional per spec "
- ✓ Other detectives compensate with text-based diagram description analysis from PDF content
- ✓ Final report notes limitation and recommends manual diagram review for Phase 2

5. Forward Plan: Phase 2 (Final Submission)

Timeline Overview



Key Milestones

Date & Time	Milestone	Deliverable
Wed 21hr UTC	Phase 1 Interim	This report + Detective Layer
Thu 21hr UTC	Judicial Layer Code	src/nodes/judges.py + src/nodes/justice.py
Fri 21hr UTC	Full Graph Integration	src/graph.py with end-to-end wiring
Sat 12hr UTC	Self-Audit Execution	audit/report_onself_generated/audit.md
Sat 18hr UTC	Peer Audit Exchange	audit/report_onpeer_generated/ + audit/report_bypeer_received/
Sat 21hr UTC	Final Submission	All deliverables + video demo + LangSmith traces

Risk Mitigation

Risk	Impact	Mitigation
Judicial prompts produce identical outputs	Score penalty for "Persona Collusion"	Test with identical evidence; enforce prompt divergence via unit tests
Chief Justice averages scores instead of applying rules	Score penalty for "LLM Synthesis"	Hardcode deterministic Python logic; unit test each rule independently
Peer audit exchange delayed	Missing feedback loop evidence	Start peer exchange early; have backup peer assigned; document fallback process
LangSmith traces not exported	Missing observability evidence	Export traces after each test run; save URLs to audit/langsmith_logs/trace_urls.txt

Testing & Observability

Unit Test Coverage (Phase 1)

```
# tests/test_state.py

def test_evidence_model_validation():

    e = Evidence(

        goal="git_forensic_analysis",

        found=True,

        content="5 commits found",

        location="git_log",

        rationale="Progressive development detected",

        confidence=0.95,

        artifact_type="git_history"

    )

    assert e.confidence >= 0.0 and e.confidence <= 1.0

def test_state_reducers():

    # Test operator.ior for evidences dict merge

    e1 = {"detective1": [Evidence(...)]}

    e2 = {"detective2": [Evidence(...)]}

    merged = e1 | e2  # operator.ior simulation

    assert len(merged) == 2  # No overwrite

    # Test operator.add for opinions list append

    o1 = [JudicialOpinion(...)]

    o2 = [JudicialOpinion(...)]

    combined = o1 + o2  # operator.add simulation
```

```
    assert len(combined) == 2  # Accumulation, not replacement
```

Integration Test Plan (Phase 2)

```
# tests/test_graph.py

def test_detective_parallel_execution():

    app = build_detective_graph()

    result = app.invoke({

        "repo_url": "https://github.com/Addisu-Taye/automaton-auditor-swarm",

        "pdf_path": "reports/interim_report.pdf",

        "rubric_dimensions": [],

        "evidences": {},

        "opinions": [],

        "final_report": None,

        "errors": []

    })

    # Verify all detectives contributed evidence

    assert "repo_investigator" in result["evidences"]

    assert "doc_analyst" in result["evidences"]

    assert len(result["evidences"]["repo_investigator"]) > 0

def test_judicial_parallel_execution():  # Phase 2

    app = build_full_auditor_graph()

    result = app.invoke({...})

    # Verify three distinct opinions per criterion

    for opinion in result["opinions"]:
```

```
    assert opinion.judge in ["Prosecutor", "Defense", "TechLead"]

  # Verify variance triggers dissent summary
  if max_score - min_score > 2:
    assert result["final_report"].criteria[0].dissent_summary is not None
```

LangSmith Observability

```
# Enable tracing in .env
LANGCHAIN_TRACING_V2=true
LANGCHAIN_API_KEY=ls__xxx
LANGCHAIN_PROJECT=automaton-auditor-swarm-week2

# After execution, export trace URLs
$ python -c "
from langsmith import Client
client = Client()
traces = list(client.list_traces(project_name='automaton-auditor-swarm-week2', limit=5))
for t in traces:
  print(f'https://smith.langchain.com/o/.../traces/{t.id}')
" > audit/langsmith_logs/trace_urls.txt
```

Appendix: File Inventory

Source Code Files

File	Lines	Purpose
`src/state.py`	85	Pydantic models + TypedDict state with reducers
`src/graph.py`	210	LangGraph StateGraph wiring + CLI entry point
`src/main.py`	45	Production entry point with argparse
`src/nodes/detectives.py`	195	Detective layer nodes with structured Evidence output
`src/tools/repo_tools.py`	245	Git sandboxing + AST parsing forensic tools

File	Lines	Purpose
`src/tools/doc_tools.py`	210	PDF ingestion + theoretical depth analysis
`rubric/week2_rubric.json`	150	Machine-readable Constitution (v3.0.0, 10 dimensions)

Infrastructure Files

File	Purpose
`pyproject.toml`	uv dependency management + build system config
`.env.example`	API key template (no secrets committed)
`README.md`	Setup instructions + run guide
`.gitignore`	Security rules + artifact exclusion

Documentation Files

File	Purpose
